ACE-FTS

Atmospheric Chemistry Experiment – Fourier Transform Spectrometer

- Canadian satellite SciSat was launched in August 2003
 - Just celebrated its sweet 16!
- ACE-FTS is a solar occultation, limb viewing instrument
 - High spectral resolution FTS in the 2.2 to 13.3 μm spectral range
 - Vertical resolution of 3-4 km, ~6-120 km altitude range
- 74 trace species are retrieved, including:
 - CFC-11, HCFC-22, HCFC-142b, CFC-12 CFC-113, HCFC-141b, HFC-134a, HFC-23
- Level 2 version 4.0 data were used in this study

New version 4.0 level 2 data

New version for ACE-FTS has been released, with new IMAGERS version

- includes more species/isotopologues

Routine species

- Tracers: H_2O , O_3 , N_2O , NO , NO_2 , HNO_3 , N_2O_5 , H_2O_2 , HO_2NO_2 , N_2 , O_2 , SO_2
- Halogen-containing gases: HCl , HF , ClONO_2 , CFC-11, CFC-12, CFC-113, COF_2 , COCl_2 , COFCl , ClO , CF_4 , SF_6 , CH_3Cl , CCl_4 , HCFC-22, HCFC-141b, HCFC-142b, HFC134a, HFC-23
- Carbon-containing gases: CO , CH_4 , CH_3OH , H_2CO , HCOOH , C_2H_2 , C_2H_6 , OCS , HCN , acetone, CH_3CN , PAN, CO_2 in lower atmosphere, and pressure / temperature from CO_2 lines
- Isotopologues of: H_2O , CO_2 , O_3 , N_2O , CO , CH_4 , OCS , NO_2 , HNO_3

ODS trends comparisons with SLIMCAT/TOMCAT

SLIMCAT/TOMCAT

- 3-D chemical transport model
 - Model output data was sampled at ACE-FTS locations
- **CFC-11**: Two different runs, with different surface CFC-11 inputs:
 - Control run: input is global average surface measurements (up to 2017)
 - -emission run: input is global average minus “extra” emissions
- **HCFCs**: Two different runs with different surface HCFC inputs
 - 2014 WMO ozone assessment values
 - 2018 WMO ozone assessment values (*both have same values before 2013*)

CFC-11

Global trend profiles

- Near 7.5 km, significant differences in ACE-FTS measurements between pre and post 2013
 - ACE-FTS and control agree for 2013-2018
 - ACE-FTS and -emission do not agree below 9 km
- Differences in ACE-FTS trend values are more pronounced in NH
 - No significant difference in the SH

Global HCFC-22 and HCFC-142b

Summary

- ACE-FTS had its sweet 16 this month!
 - Version 4 of the L2 data is now available; go download now and play!
- Near 8 km, ACE-FTS observes a significant increase in the CFC-11 trend after 2012
 - More pronounced in NH than SH
- The trend in CFC-11 concentrations below 9 km is significantly larger than in the scenario of no “extra” surface emissions
 - Effects are not distinguishable (beyond the uncertainty) at higher altitudes
- HCFC-22 and HCFC-142b trends are slower than what was predicted in 2014
 - Increasing trends are slower than if industry was phasing out at speed Montreal Protocol allows
 - ACE-FTS HCFC-142b trends in the 7-10 km region are not significantly different than 0 pptv/year (although they're fairly noisy...)

Thanks!

The extra bits...

Linear regression

- Fit ACE-FTS and SLIMCAT data to model:

$$f(t) = \underbrace{a + bt}_{\text{linear comps}} + \underbrace{\sin(2\pi(\phi_1 - t))}_{\text{annual cycle}} + \underbrace{\sin(4\pi(\phi_2 - t))}_{\text{semi-annual cycle}} + QBO_1 + QBO_2 + ENSO + Trop$$

- Fit is done for 2004-2012 and 2013-2018
 - Calculated errors shown are 99% confidence intervals

ACE-FTS global coverage

CFC-11 direct comparisons

CFC-11 hemispheric

- ACE-FTS trend values are only significantly different in NH (below 9 km)
- No significant difference in the SH

CFC-11 hemispheric

- ACE-FTS trend values are only significantly different in NH (below 9 km)
- No significant difference in the SH

CFC-12

- ACE-FTS and CAT exhibit more negative trend of CFC-12 concentrations in 2013-2018 than 2004-2012
 - In both data sets, trend change is greater than combined uncertainties

- Change in trend is generally more positive than negative
- Especially in NH (compared to SH) in UTLS
 - Changes are not greater than the combined trend uncertainties

- Change in trend is generally more positive than negative
- Especially in NH (compared to SH) in UTLS
 - Changes are not greater than the combined trend uncertainties
